

## **Kitchen Revolution: 3D Choco Printer mycusini**

The enthusiasm for Choco unites the young team of the German startup Print2Taste. With mycusini, the company, founded in 2014, has developed the first 3D Choco printer for consumers.

Easy-to-create text messages, a template library of over 100 creative items, and easy-to-use controls add fun. Thus, individual delicious 3D Choco gifts or cake labels can be created as well as the Choco highlight for a dessert.

And this is how it works: for example, the production of a choco hollow mold is started directly on the display of the mycusini. Subsequently, this mold can be, for example, filled with a mascarpone cream and arranged together with some fruits on a dessert plate. With such a dessert creation you even challenge a professional pastry chef.

About the size of a coffee machine mycusini fits into every kitchen. The device works with special 3D Choco Refills, which are included in the delivery - this makes an immediate experience of success possible.

With a price of 398 €, the mycusini is also ideal as a gift. Why not even produce Choco in 3D under the Christmas tree?

The delivery includes everything needed for a quick start - in addition to the 3D Choco printer mycusini, the 3D Choco Refills and free access to a comprehensive template library and numerous applications for the creation of 3D models.
